

EcoLoop — Competitive Landscape

Egypt — Direct Competitors

Bekia (\$580K funding) — the closest direct competitor. Connects households wanting to dispose of recyclable waste with local collectors, rewarding users with cash or redeemable points for groceries, school supplies, and mobile credits. Purely B2C — not a B2B2C model, and not structured around residential compounds as a collective entry point.

Big Scrappers — a platform available on Android and iOS where users arrange for couriers to collect non-organic waste from their home in exchange for cash and redeemable points. Strong focus on aluminium and metals. Also has physical stores and B2B programs for companies and schools, but core model remains individual-to-collector.

Plstka (\$155K funding) — collects solid waste through a gamification mobile app. Different model — not a logistics or coordination platform.

Drop Me — builds locally manufactured Recycling Vending Machines with a real-time tracking dashboard. Depends on heavy physical infrastructure, not a digital coordination layer. High capital cost limits speed of scale.

Regional — MENA

Sparklo — uses AI-powered Reverse Vending Machines across MENA; residents earn points redeemable for rewards. Requires significant physical infrastructure investment per location.

Edama Organic Solutions (Saudi Arabia) — recycles organic waste and converts it into high-value compost for desert agriculture and land restoration. Specialized in organics, not a residential recycling coordination platform.

Veolia Middle East — identifies the core challenge clearly: only 10% of generated waste in the region is effectively recycled, and the sector needs solutions that reinvent waste collection, develop a recycling culture, and strengthen the economic balance of recycling businesses.

Global — Closest Models

Rubicon (USA) — connects businesses with waste haulers through software. Succeeded in B2B but not residential coordination.

Recycle Coach (Canada) — app that educates households on waste separation and collection schedules. Education-first, not a logistics or supply chain platform.

Curbside (USA, acquired) — connected households with recycling pickup services. Closest model to EcoLoop structurally, but built for a market with existing municipal infrastructure.

The Real Gap

Every existing solution in Egypt solves one side of the equation. None of them solve the coordination problem between all three actors simultaneously.

Player	What They Solve	What They Miss
Bekia / Big Scrappers	Individual-to-collector connection	No B2B entry point; no compound-level aggregation
Drop Me / Sparklo	Physical collection infrastructure	High capex, slow to scale, no supply chain visibility
Plstka	Individual behavioral change	Doesn't create consistent, sortable supply for recyclers
Municipal systems	Coverage	No digital integration, no data, no source separation

EcoLoop’s differentiated position:

Rather than acquiring users one household at a time, EcoLoop enters through **property managers of residential compounds** as a B2B entry point — one decision covers 200+ units. This creates a **structured, predictable supply chain** for recycling companies that currently depend on inconsistent informal networks and have zero visibility into incoming material quality or volume.

The market potential for waste management and recycling in Egypt exceeds \$5 billion annually, with investment requirements surpassing \$6 billion. Urban waste collection rates reach up to 85% in cities, yet an estimated 80–88% of municipal waste still ends up in open dumpsites. The infrastructure exists to move waste. What doesn't exist is the coordination layer that makes recycling the default outcome of that movement — and that is EcoLoop’s precise position.
