

EcoLoop — MVP Scope

The Single Bet

The MVP does not try to build everything. It tests one hypothesis: if a property manager can request a scheduled recyclable waste collection through a simple digital interface, and a verified recycling partner shows up reliably, will compounds adopt the behavior consistently?

Everything else is deferred until that question is answered.

What the MVP Includes

1. A lightweight web app — not a native mobile app

A simple web-based platform accessible from any browser. No App Store approval cycles, no native development cost. Two interfaces only:

- Compound Manager Portal — register compound, schedule a collection request, view collection history, download monthly reports for building management records.
- Recycling Partner Portal — view incoming requests, confirm pickup, log material type and estimated weight collected.

No consumer-facing interface. No individual household registration. The compound manager is the only customer in MVP.

2. A verified network of 3–5 recycling partners in one city

Cairo or Alexandria — one city only. Manually onboard 3 to 5 existing licensed recycling companies or collectors. Verify they can handle the volume, show up on schedule, and accept sorted material. No algorithm. A human coordinator manages the matching in Phase 1.

3. A structured collection protocol — the physical SOP

A one-page laminated card distributed to every compound unit explaining exactly what to separate, how to bag it, and where to leave it before collection day. Physical behavior change before digital behavior change.

4. A simple data layer

Every collection logged: compound ID, date, material type, estimated weight, recycling partner. This data becomes the product's defensible asset. Recycling companies pay for reliable supply — the data proves the supply is reliable.

What the MVP Deliberately Excludes

- Individual household app or registration
- Reward or points system
- AI sorting or smart bins
- Expansion beyond one city
- Real-time tracking
- Payment processing (first 3 months run on free pilots with partner compounds)

Target for MVP Phase — 90 Days

Metric	Target
Compounds onboarded	5–10
Recycling partners verified	3–5
Collections completed	20+
Avg. material weight per collection	Measured and logged
Compound manager retention	At least 70% request a second collection

The last metric is the only one that matters. Repeat behavior from the compound manager means the model works. Everything else is noise.

Why This MVP, Not Another

Going B2C first (individual households) would mean acquiring hundreds of users to generate the same volume one compound manager unlocks with a single decision. The compound entry point is the highest-leverage, lowest-friction path to proving demand — and to generating the sortable, predictable supply that makes recycling partners willing to pay for access to it.
